Axial piston pumps type PVPC
variable displacement, by a full line of mechanical controls

PVPC are variable displacement axial piston pumps for high pressure operation, with low noise level, suitable for hydraulic oils or synthetic fluids having similar lubricating characteristics. The actual displacement is dependent on the length of stroke of the pumping pistons. This length of stroke is determined by the position of the swash plate that is achieved by two servo pistons with differential areas, against a spring. The rotating barrel forces the pistons in a circular path in and out of the barrel and fluid displacement takes place. Typical section on side shows version L with manual pressure compensator and flow regulation. The available hydraulic controls are shown in sections 8. The wide range of electrohydraulic proportional controls is shown in tab. A170. SAE J744 mounting flange and shaft (note 1). Max displacement: 29-46-73-88 cm³/rev. Max pressure: 280 bar working, 350 bar peak.

1) optional intermediate displacements 35 and 53 cc/rev are available on request
2) pumps with ISO 3019/2 mounting flange and shaft (option /M) are available on request

2) pumps with ISO 3019/2 mounting flange and shaft (option /M) are available on request

### Notes:
- For speeds over 1800 rpm the inlet port must be under oil level with adequate pipes.
- Maximum pressure for all models with water glycol fluid is 160 bar, with option /PE is 190 bar.
- Max speed with options /PE and for water glycol fluid is 2000/1900/1600/1500 rpm respectively for the four sizes.
### 3 MAIN CHARACTERISTICS OF VARIABLE DISPLACEMENT AXIAL PISTON TYPE PVPC

<table>
<thead>
<tr>

### 6 INSTALLATION POSITION

**VERTICAL INSTALLATION**

**INSIDE THE TANK**
Minimum oil level equal or above the pump mounting surface:
A ≥ 200mm

**INSIDE THE TANK**
Minimum oil level below the pump mounting surface:
Minimum inlet pressure = 0.8 bar (absolute)
B ≤ 800mm, C= 200mm

**OUTSIDE THE TANK, above oil level**
Minimum inlet pressure = 0.8 bar (absolute)
B ≤ 800mm, C= 200mm

**HORIZONTAL INSTALLATION**

**INSIDE THE TANK**
Minimum oil level equal or above the pump mounting surface:
A ≥ 200mm

**INSIDE THE TANK**
Minimum oil level below the pump mounting surface:
Minimum inlet pressure = 0.8 bar (absolute)
B ≤ 800mm, C= 200mm

**OUTSIDE THE TANK, above oil level**
Minimum inlet pressure = 0.8 bar (absolute)
B ≤ 800mm, C= 200mm

**OUTSIDE THE TANK, below oil level**
Minimum inlet pressure = 0.8 bar (absolute)
C= 200mm

IN: inlet line - D1: drain line - A: minimum distance between inlet and drain line - B+C: permissible suction height - C: inlet line immersion dept
7 DIAGRAMS at 1450 rpm (based on mineral oil ISO VG 46 at 50°C)

7.3.2 Variation of inlet pressure and reduc-
tion of displacement with increasing
speed rating
Manual pressure compensator
The pump displacement decreases when the line pressure approaches the setting pressure of the compensator. The pump supplies only the fluid required by the system. Pressure may be steplessly adjusted at the pilot valve.
Compensator setting range: 20 ÷ 350 bar (315 bar for 090)
Compensator standard setting: 280 bar (250 bar for 090)

Manual pressure compensator with venting
As C plus venting function, when a long unloading time is required and heat generation and noise have to be kept at lowest level.
Venting valve solenoid voltage, see section 8
Venting valve OFF = null displacement
Venting valve ON = max displacement
Compensator setting range: 20 ÷ 350 bar (315 bar for 090)
Compensator standard setting: 280 bar (250 bar for 090)

Remote pressure compensator
As C, but with remote setting of the compensator by means of a pressure relief valve on the piloting line X.
This version can be obtained from version L using a blind plug UNI 5923 M4x12 in pos. 1 and a restrictor M4 drilled ø 0,75 mm in pos. 2.
Compensator setting range: 20 ÷ 350 bar (315 bar for 090)
Compensator standard setting: 280 bar (250 bar for 090)

Load sensing
The pump displacement is automatically adjusted to maintain a constant (load independent) pressure drop across an external throttle. Changing the throttle regulation, the pump flow is consequently adjusted.
Load sensing control always incorporates an hydraulic compensator to limit the maximum pressure.
Compensator setting range: 20 ÷ 350 bar (315 bar for 090)
Compensator standard setting: 280 bar (250 bar for 090)
Differential pressure setting range: 10 ÷ 40 bar
Differential pressure standard setting: 14 bar

Constant power
In order to achieve a constant drive torque with varying operating pressure. The swashing angle and therefore the outlet flow is varied so that the product of flow and pressure remains constant.
For the best regulation, minimum working pressure is 80 bar.
While selecting LW control, the required value of power must be communicated with the order (ex. 10 kW at 1450 rpm).
